A Special Autumn Equinox

Long-Term Weather

We have seen some strong winds at times. However, in the South-East, we have also had some reasonably dry and more settled periods, with a powerful sun warming the land and making this feel like a second spring.

These conditions will persist into the middle of this week.

Then, high pressure may make its way into the southern regions of the UK, perhaps bringing more widely settled conditions for a week or so, starting Thursday, 24th September, especially away from the far north.

Temperatures for this period will probably be close to average in the North, but rather warmer most of the time, along with relatively cool nights.

Equinoctial Winds

A few decades ago, when I first came to England, I would experience, at this time of year, two weeks of strong equinoctial, gale-force winds. As the trade winds retreated southwards and the Arctic air flowed in strongly, huge frontal systems would move in from the Atlantic. With the magnetosphere opening up at this time of year, this creates a great change of cleansing winds and rains, driving the old summer away – darkness winning the hand over daylight.

The days and nights will be 12 hours equal on the 25th/26th of September this year.

Grey Days in the Maria Thun Biodynamic Calendar

If you use the Maria Thun Biodynamic Calendar, you might often notice grey lines going through your calendar days and wonder: what is happening that means I can't garden on these days?

What Else Is Going On in the Sky?

At the spring and autumn equinox, an additional anomaly regularly occurs, which creates strong phenomena of the Aurora Borealis in the night sky.

How does this happen?

"Cracks are opening in Earth's magnetic field. Researchers have long known that during weeks around equinoxes fissures form in Earth's magnetosphere. Solar wind pours through the gaps to fuel bright displays of Northern Lights."

NASA and European spacecraft have been detecting these cracks for years. Small ones are about the size of California, and many are wider than the entire planet. There's no

danger to people on Earth. Our planet's atmosphere intercepts the rush of incoming particles with no harm done and a beautiful afterglow.

Further disturbances of the ionosphere are being caused by events like this: SpaceX rockets carrying a Space Force surveillance satellite may have created a hole in the ionosphere as they shot into space on 14th September. Is this a coincidence, or just an added factor in the strong disturbances caused on that date, adding to the spectacle of extraordinary Aurora Borealis sightings?

Why Is This So Important for Us to Know?

Around the turn of the 19th century, Rudolf Steiner, growing up in Croatia, and Victor Schauberger, living in South-East Austria, witnessed a strange custom.

Farmers would stand and lean over a big barrel in the middle of their fields, humming into the water, which they stirred in vortex fashion after having added a handful of clay to it.

When Schauberger asked the farmer he met in his field about this practice, the farmer said that, after ploughing, the "virginal skin", which could be seen as a blue-purple fluorescent light at 60 cm above soil level, was destroyed. By stirring and humming into the moving water with the piezoelectric qualities of the clay, they restored that virginal skin.

This suggests, on further investigation, that the plants, through their life forces, were able to protect the Earth's surface from otherwise harmful cosmic radiation, turning it into a protective light and energetic layer that actually enhanced plant growth.

If it's true that, by just removing plants, cosmic radiation is harming the soil and its organisms, can you imagine how severe the damage to the soils and living organisms could be as the radiation penetrating the Earth is now much stronger than ever before?

In addition to all those 'natural' factors, we have added 5G radiation (radar microwave frequency) and radioactive fallout, which Dr Ehrenfried Pfeiffer (biodynamic pioneer in Holland, England and the USA) was very concerned about.

I would like to encourage you to think, in our biodynamic practices, beyond our own gardens or land and contemplate what you can do to heal the overall environment by applying the horn manure preparation and the horn silica preparation. Also, start thinking about possibly elaborating a clay preparation to protect the Earth and soil from the onslaught of damaging radiation and help transform it into healing energy.

Think about this: any substance, or even cold or heat, that you take into your body without moderating, digesting, transforming it and making it your own, your body identifies as foreign and initiates a strong allergic or feverish reaction so that your being

(spirit) can destroy it, moderate and transform it, and incorporate it as food and nourishment.

Once we realise that the whole Earth organism is exposed every day to foreign substances, energies and forces coming into the Earth's natural environment, wouldn't you think it is our responsibility to use healing substances, as we have with the biodynamic preparations, to heal our Earth organism and the soil and, in turn, produce healing foods and a healthy biosphere?

So, possibly prepare for the autumn equinox, which falls this year on the 25th/26th September, and yet another big event happening, with the Moon occulting Jupiter this time and with the natural crack in the magnetosphere, whose detrimental effects we could possibly lessen by spraying horn manure and clay preparations.

I encourage you to try simply stirring ordinary clay (with piezoelectric qualities) for 60 minutes.

Why? As indicated in research papers:

Science can, through technological means, cause the elimination of pathogenic bacteria and clean water by exposing them to water droplets enriched with a clay-based piezoelectric membrane for 60 minutes and exposed to the influence of ultrasound.

Might it be possible that we could achieve the same with clay being stirred in a bucket for 60 minutes and enriched by our own natural voice?

It is worth starting to experiment to clean our soils and protect our environment.

Rudolf Steiner suggested in the Agriculture lectures experimenting with the clay preparation, and I believe that, as he just scratched the surface, we need every one of you to make more breakthroughs in science and spiritual scientific research.

I hope you are still with me and understand the essence and urgency of applying biodynamic preparations in your garden, which will possibly have far-reaching benefits and results in your wider environment.

Traditional farmers grew more than just food; they grew health for the land and people.

Happy Equinox,

Hans-Günther
